Introduction

This newsletter covers the activities of the Warwickshire Fungus Survey during 2015 as recorded by the group members and although its primary purpose is to present the mycological records, other articles and contributions would be welcome. The records generally concern the foray programme but non-foray records from individuals and other groups have also been included where they represent a new site record or an unusual / interesting occurrence. Where available, habitat and substrate information has been noted and observers are urged to record this important data whenever possible.

Reminder: Would forayers submitting dried specimens for the herbarium please ensure that they are accompanied by notes, particularly of characters that cannot be checked from dried material. These include, for agarics, fresh colour and any colour changes with age, handling or bruising and changes to the flesh colour when the fruit body is longitudinally sectioned; is the cap and or stem viscid, sticky?; peelability of the cap (*Russula*), milk colour and changes on drying (*Lactarius*); smell; taste. Also please provide a spore print and details of the literature consulted in arriving at a determination. Herbarium numbers are of format WFS9999.

Species names have generally been taken from the *Checklist of the British & Irish Basidiomycota* (N. W. Legon, A Henrici *et al*) and the British Mycological Society's computerised dictionary of fungus names (GBCHKLST, 11.01.09). Where this name differs from older names and is not yet in common usage, the older name is indicated in brackets after the current name for the first mention. In certain cases where species have been 'lumped' the original name is listed for future clarity. Note that updates 1 to 6 to the above checklist are now available at website <http://www.basidiochecklist.info>. References to the *Flora* relate to Clark, M. C. (1980) *A Fungus Flora of Warwickshire*.

The WFS website may be accessed by address <http://wfs.bnhsoc.org.uk>.

* indicates new to site. Up-to-date lists are not available for all sites.

** indicates new to vice-county 38.

The following recorders have been identified by their initials and are shown in the sequence collector/determiner/confirmier (where different):

DJA	David Antrobus	DC	Dave Champion	JRR	John & Val Roberts
JA	Janet Antrobus	DG	Dinah Griffin	RJS	Jane Sells
ASB	Alan Bean	CH	Clare Hinchliffe	JDS	John Sells
AWB	Bert Brand	WTM	Bill Moodie	GT	Graham Thompson
GMB	Gill Brand	KR	Kay Reeve	JW	John Williams

Unless stated otherwise the following plant/tree species may be inferred from their genus:

Genus	Species	Genus	Species
Aesculus	<i>Aesculus hippocastanum</i>	Fraxinus	<i>Fraxinus excelsior</i>
Alnus	<i>Alnus glutinosa</i>	Heracleum	<i>Heracleum sphondylium</i>
Castanea	<i>Castanea sativa</i>	Ilex	<i>Ilex aquifolium</i>
Chamerion	<i>Chamerion angustifolium</i>	Quercus	<i>Quercus robur</i>
Corylus	<i>Corylus avellana</i>	Rubus	<i>Rubus fruticosus</i> agg.
Crataegus	<i>Crataegus monogyna</i>	Taxus	<i>Taxus baccata</i>
Fagus	<i>Fagus sylvatica</i>	Urtica	<i>Urtica dioica</i>

WARWICKSHIRE FUNGUS SURVEY

Foray Records

2015

It was a better year with some interesting finds but many of the previously common species are no longer present.

Hampton Wood Nature Reserve

17.05.15

Eight regulars and two visitors attended the first foray of the year on a pleasant but slightly chilly morning with the wood full of bluebells and other spring flowers.

MYXOMYCETES

Ceratiomyxa fruticulosa	on rotten branch	DG
Lycogala terrestre		DG

PHYCOMYCETES

Peronospora niessliana	<i>Alliaria petiolata</i> , living leaf	GMB

Kingsbury Meadow Nature Reserve

16.08.15

Seven of us turned up for our first visit to this reserve recently acquired by Warwickshire Wildlife Trust (WWT). We were not expecting to find fungi but it was a pleasant morning for a walk as we circumnavigated the meadow. A few insects on the wing included Holly Blue, Speckled Wood, Large White, Green-veined White and Brown Hawker.

ASCOMYCETES		DISCOMYCETES
Rhytisma acerinum	on <i>Acer pseudoplatanus</i>	JRR

Oversley Wood

04.10.15

It was another beautiful morning as we drove across a field of stubble to our parking spot near the wood to avoid the expected mass of participants on a local cycling / orienteering event. This must have been a disappointment for the organisers as there appeared to be few entrants and the wood was as quiet as normal. The recent dry spell limited the number of species but several uncommon fungi were found. David Antrobus did well to spot a new *Pluteus* very similar to *P. cervinus*.

This foray had special significance as it celebrated the 50th year of the WFS and also, to the surprise of many, Bert Brand's 90th birthday. Bert had organised a lunch in a nearby hostelry which was much appreciated by the group.

Bartheletia paradoxa:

a living fossil fungus growing on leaf litter of a living fossil tree

One of our new county records in 2015, *Bartheletia paradoxa*, has presented a problem about where it fits in fungal classification. This fungus grows only on leaves of *Ginkgo biloba* which have fallen to the ground. This tree is the maidenhair tree which has fan-shaped leaves. It is the only survivor of an ancient group of trees (close to the Gymnosperms) whose fossils are most common in Jurassic and Cretaceous deposits. It was grown in temple gardens in China and Japan and was introduced into Europe in the 1700s. It is now very widely planted in parks and gardens.

Bartheletia paradoxa was collected in France by Barthelet in 1932 and a detailed investigation of its structures and life cycle with a Latin diagnosis was published in 2008 (Scheuer, Bauer, Lutz, Stabentheiner, Mel'Nik & Grube (2008) Mycological Research 112). The fungus grows only on fallen leaves; conidia are formed within days of leaves landing on the ground and thick-walled spores (teliospores) over the next few weeks. These remain dormant for a year when they germinate to form elongations with terminal swellings which are longitudinally septate into 4 cells (basidia) and produce external spores (basidiospores). Molecular phylogenetic analysis indicates that the fungus has no close living relatives and is derived from a basal branching of the Basidiomycotina. It has to be placed as a genus of uncertain affinity in the Phylum Basidiomycota i.e. separate from the Newsletter's conventional groupings of Homobasidiomycetes, Heterobasidiomycetes and Urediniomycetes.

G. biloba does not readily reproduce from seed and new plantings are usually purchased from nursery growers. The fungus has not been detected on falling leaves captured before they reached the ground but appears always to develop on leaves which have fallen to the ground. We first recognized *B. paradoxa* on fallen *Ginkgo* leaves under a tree in Clifford Chambers in June 2015 and, after *Ginkgo* leaf fall in November, on leaves on the ground at all four sites of the tree that we know in the Stratford upon Avon area.

Fallen leaf samples from other *Ginkgo biloba* sites in Warwickshire would be welcomed by me.
